Machine rotors per the manufacturers instructions making sure the lathe is clean, within specs and has sharp tool bits.

- After the finish cut has been completed, sand both sides of the rotor for one minute per side using a sanding block and 120 to 150 grit sandpaper to obtain a non-directional finish.

- When sanding operation has been completed, wash the rotor with dishwashing soap and water. Do not clean the rotor with a brake clean/solvent based product.

- Calipers, caliper sides and hardware should be thoroughly cleaned of dirt, rust and grease.

- Caliper sides and disc pad shims/insulators should be given a thin film of silicon based paste to insure lubrication. Do not use a petroleum based product, or spray adhesive type product.

- Please make sure the disc pads are tight in the caliper.

- When installing the wheels, make sure the lug nuts are torqued to manufacturer's specifications.
