

# Wyzo Launch Video Script

This, is Wyzo.

Wyzo is a sidebot, part of a new class of industrial robots designed to work safely and efficiently alongside humans.

Traditional pick & place robots are large and complex, designed to work on fully automated production lines.

But not Wyzo. Wyzo can function even when your workers are close by, allowing for more versatility while ensuring safety.

Thanks to its small footprint, Wyzo can be installed anywhere on a production line. It's also easy to move, so it can go and help you where you need it most.

But don't let its small size fool you. Wyzo was designed for performance. Its high-tech arm and vision system can find and manipulate products and containers at high speeds, even on conveyor belts.

Highly compatible, Wyzo works with all regular grippers on the market. That means you can use it for any pick & place application.

The mobile terminal on the side houses a state-of-the-art pick & place software that has been specially refined for ease of use and control. That means no more time wasted on complex programming.

Thanks to its array of sensors and certified control system, Wyzo is always aware of its surroundings. This allows it to adjust its performance while ensuring maximum safety at all times.

A new benchmark for collaborative production, that combines the best of human and machine abilities. Wyzo can help you go faster, and further, than ever before.

Are you ready? Find out more and book a demonstration on [thewyzo.com](https://thewyzo.com)

Faster and further, together.
