2019/2020

WA Pest Manager
Of The Year
2017/2018

Why Choose Perth's Most Awarded Termite, Pest & Weed Control Company?

The Envirapest team care about the safety of your family, quality workmanship and simply providing down to earth customer service. Still wondering?? See what our other amazing clients think with our 5 star google reviews. ★ ★ ★ ★ ★

We have been an integral part of the pest control industry in Perth for over 20 years. We are a small, family run business - delivering the kind of quality service that is hard to find amongst the trade industry today. Envirapest use only the latest termite detection technology & environmentally safe products. Our company is licenced and insured and all of our work is completed to Australian Standards.

We were awarded the National Pest Manager Of The Year for a business of 1-10 employees in 2017/18 and again in 2019/2020.

All of our termite barriers generally come with a host of **free services** including general pest treatments, spider, cockroach & ant treatments, rodent baiting & general weed treatments.

When protecting your biggest investment - Why choose anything less.

Control termites with confidence

Termidor® Residual

Termiticide & Insecticide

Termidor® HE

High-Efficiency Termiticide

What makes Termidor so effective

The crucial advantage Termidor has over many other products is that it doesn't repel termites.

Termites are able to detect the older chemicals in the soil and stay away from them. That means the termites remain active and unaffected, still exploring the area and potentially looking for ways into your home.

Termites can't detect the treated zone so, as they continue to forage through the soil, they unknowingly come into contact with Termidor.

Affected termites transfer Termidor to others by contact, grooming and exchange of food.

The Genuine Termidor Transfer Effect™

Because affected termites can't detect Termidor, they carry it back to the nest on their bodies and pass it on to other termites, hence the devastating Genuine Termidor Transfer Effect.

Termidor can control whole termite populations faster than any other treatment, but it is relatively slow-acting in individual termites. This means termites have ample time before dying to spread Termidor to their nest, and the entire colony.

The combination of Termidor being undetectable in the soil and its Transfer Effect mean no other termiticide performs as well as Termidor.

Why should you insist on Termidor?

Over 400,000 homeowners for the past 19 years have been satisfied with Termidor protecting their homes, without a single product failure. That is why it comes with an eight-year warranty and is Australia's number one trusted brand for termite control.

Termidor's Genuine Transfer Effect™ takes advantage of the social behaviors of termites living and feeding in large colonies where they are in constant contact. When a single termite comes into contact with a Termidor treated zone, it will unknowingly transfer it back to

the colony on its body, infecting termites that have not even been near the Termidor treated zone. This is the 'Transfer Effect' and a key reason why no other termiticide performs as well as Termidor. Termites can't detect Termidor due to its innovative, non-repellent technology, so they can pick up a lethal dose while foraging in treated areas. As a result, Termidor works quicker and more effectively than other inferior termite control options.

What's involved?

1. An Accredited Termidor Applicator will conduct a thorough inspection of your property – should termites be found, a treatment with Termidor Foam will be required to quickly stop activity within your home.
2. A trench will be dug around your home in preparation for the Termidor application.
3. Termidor will be applied to the soil as it is back filled.
4. Holes are drilled through paths and concrete areas or concrete is cut away to gain access to the soil.
5. Pavers, if not concreted in, must be lifted, the soil treated underneath and the pavers re-laid.
6. Some soils, such as heavy clays, may be removed and replaced with a sandy loam before treatment.
7. A follow-up visit is recommended by your Accredited Termidor Applicator.
8. Ongoing inspections of your home and surrounds at least every 12 months, and more frequently in high risk situations, are recommended.

Termidor HE, the most advanced termite protection yet

In 2017 BASF introduced Termidor HE 'High Efficiency' termiticide, the next step in termite treatment following Termidor Residual. Termidor HE is a new advanced termite protection solution, which allows the establishment of uniform and consistent termite protection for your home, whilst reducing the risk of damaging the aesthetics of your home.

A new level of effectiveness

Termidor HE is an advanced formulation of the same extremely powerful active ingredient that has made the original Termidor products the most trusted and effective termite treatments.

Termidor HE spreads much further through the soil than older treatments, to create a more even and effective protective zone which termites cannot avoid.

Termidor HE binds strongly to organic matter in the soil and, as long as the soil isn't disturbed, stays in place for years. So it's not just superior protection at the start, it goes on providing the highest level of protection year after year.

Standard treatments have very limited movement through the soil and can be unevenly distributed within the protective zone.

New Termidor HE spreads through the soil to create a deep, invisible, even and unbroken protective zone all termites are affected by.

A new level of convenience

The advanced technology in Termidor HE gives your Accredited Termidor Applicator more scope to provide a superior treatment, without cutting corners or disturbing the structure and damaging the aesthetics of your home.

The increased movement of Termidor HE through the soil means it is unlikely that you will be required to drill through tiles, and that treatment won't be compromised by obstacles like underground pipes.

The end result is a more effective protection zone that can leave your home looking just as it did before. That's more convenient for you and your family.

When holes need to be drilled for treatment beneath outdoor or indoor surfaces, the smaller spaces required between standard treatment application sites can result in unsightly disruption and damage.

Termidor HE allows for application sites to be placed in more discreet areas (such as grout lines), which means a thorough treatment can be performed with minimal visual impact and risk of damage.

Conventional Standard treatments require significant trenches to be excavated well below the footing. The trenches are then backfilled with treated soil to form the protective zone. This large scale excavation can lead to significant disruption and damage to landscaped areas.

New Termidor HE is applied in shallower trenches. Advanced polymer technology then allows its active ingredient to spread down and form a protective zone at least as deep as standard treatments provide. This results in a superior treatment with less disruption and damage.

Termite Issues in Australia

Termites are a highly destructive pest and a major cause of economic damage to homes around Australia. One in three homes in Australia has been affected by termite damage. There are hundreds of termite species around Australia, although only a small number of these species are responsible for structural damage to our homes.

Although the coastal belt and northern parts of Australia are generally regarded as the highest-risk areas for subterranean termite infestation, economically significant species, which damage timber, are found throughout mainland Australia. In reality, any structure containing wood is at risk of subterranean termite infestation whether in the city, suburbs or country, unless protective measures are taken.

Conducive conditions around your home

There are many conditions, which may be present around your home, that may be conducive to termite activity. Water and leaks associated with faulty plumbing, broken roof tiles, leaking shower recesses and air conditioning drainage can all contribute to a build-up of moisture in the surrounding soil, creating perfect conditions for termites. Trees, shrubs and gardens adjacent to your home can result in an excess in roots, moisture and other organic matter, allowing termites to establish and gain access undetected into the foundations, expansion joints or other concealed entry points. It is recommended that your home is inspected annually by a pest management professional. This not only identifies any termite activity in the structure, but will also ensure that any conducive conditions are identified so they can be rectified to reduce the risk to your home.

Trelona® ATBS

Advance Termite Bait System

Trelona ATBS – A revolution in termite baiting technology

Termite baiting is designed to protect structures by eliminating foraging termites around your home. The Trelona ATBS (Advance Termite Baiting System) has been developed to allow pest management professionals the opportunity to tailor the most appropriate termite management solution, for any Australian home. Trelona ATBS combines the latest research in termite behaviour with the most advanced termite bait system to provide:

1. A sturdy and discrete bait station, designed to encourage station interception and feeding,
2. A system which can be applied as both a monitoring or an active system, providing year-round protection,
3. An advanced bait matrix, containing revolutionary termite bait technology that makes it irresistible to termites, and
4. The only system, specifically designed to be used in with the Termidor® range of products.

What to expect

Prior to installation of Trelona ATBS, a pest management professional will conduct an inspection of your home to determine, what management of termites within your home is required, what remedial steps may be required and the most appropriate installation and management plan for your home and circumstances.

On installation, ATBS stations will be installed around your home, at approximately 3 metre spacings. Your pest management professional will then identify the required inspections period, which may vary from one to six monthly intervals, depending on the level of activity, sites risks and the type of system to be installed (monitoring vs. active).

Combined protection - unmatched piece of mind

The unique advantage of Trelona ATBS is that it can be used in combination with Termidor Residual termiticide and insecticide and Termidor HE high-efficiency termiticide.

Termidor has been the most trusted name in termite control since 2002 and has been the benchmark for termiticides in the Australian market. This trusted technology can now be combined with the most advanced baiting system available.

Due to termite risk or construction design, a combined treatment may provide the most adequate and thorough protection for your home (Figure 1). Where required or in instances where additional “piece of mind” is desired, your pest management professional may design a treatment plan combining the power of these two trusted technologies.

Sentricon Always Active

Traditional methods have involved either chemical barriers or baiting systems.

Chemical barriers are designed to deter termites from entry into the house. The challenge with chemical barriers is that they deteriorate over time and are often breached by a dog digging or a new garden bed, meaning if they are not replenished every 5 years or so, there could be gaps appearing in the barrier that may be found by the termites, allowing them entry into the home.

Chemical barriers also do not get to the heart of the threat, the nest, which means any nearby colony will survive and be a constant threat to your property. Liquid barriers involve the use of hundreds of litres of chemical around the house which potentially pose a threat to you, your family, your pets and the environment.

Baiting systems involve placing monitoring stations around your property which are monitored at regular intervals, usually every three months. If termites are discovered, then the bits of wood are replaced with the bait which is then ingested and taken back and shared in the colony.

The bait disrupts the normal functioning of the colony and once feeding on the bait has started, elimination of the colony occurs. The key problem with this system is that it is possible for termites to attack the wood immediately after it is inspected thus leaving your home under attack for up to three months before the termites are discovered and the bait introduced.

Sentricon AlwaysActive is the only system which combines the positive aspects of both these systems and eliminates the negatives.

How does Sentricon Always Active work?

Installed strategically and discreetly around the home in the prime foraging areas, the Sentricon station provides a window into the world of the termites. The random and continuous foraging of the termites will be directed to the In-Ground stations.

The stations contain Sentricon IG Termiticide Rods which the termites find more palatable and more attractive than wood. The termites feed on the termiticide rods on mass, tunnel back to the nest all the while unaware that it is detrimental to their survival. The active ingredient in Sentricon AlwaysActive is what's called an insect growth regulator, which means it is specific and deadly to termites, but safe to you and your family. Termites periodically shed their skin (moult), and this process is interrupted once ingestion of the Sentricon AlwaysActive occurs. An inability to moult results in the death of the workers, and ultimately leads to the elimination of the entire colony.

What makes Sentricon the best solution?

Sentricon AlwaysActive is your best solution because it is the only system that continually protects your home from the moment it is installed and acts as discreetly and silently as the termites that can attack it. In effect, it provides the security and peace of mind you associate with other home protection devices, such as a house alarm system.

Furthermore, Sentricon should be your chosen method of control because:

- It offers the safety of a baiting system and the continuous protection of a chemical barrier.
- There is no drilling, digging or disruption to your home.
- It is safe for your family, pets, and the environment.
- It eliminates the termite colony completely unlike some chemical barriers that often only repels the localised activity.
- It offers continuous protection from day one unlike some systems that may leave your home vulnerable to attack for months.

 **SENTRICON**
ALWAYSACTIVE™

A UNIQUE NEW WAY TO PROTECT YOUR HOME

Sentricon® AlwaysActive™ is the new and very different way of continuously protecting your home against termites, harnessing the natural behaviour and biology of termites, together with a highly effective termiticide.

Sentricon AlwaysActive is a highly effective solution that offers the safety of a baiting system and the continuous protection of a chemical barrier.

Sentricon AlwaysActive is a unique and environmentally sensitive termite control system that protects your home all day, every day from day one. Eliminating termites before they are even discovered.

FREQUENTLY ASKED QUESTIONS ABOUT SENTRICON® ALWAYSACTIVE™

Q: How is Sentricon AlwaysActive different from other methods of termite protection?

A: Current termite management systems are either a chemical barrier or a baiting system. Sentricon AlwaysActive is unique as it combines the best of both, without any of their drawbacks. Sentricon stations are placed strategically and discreetly around your home to form a continuous barrier. The Sentricon stations contain Sentricon IG Termiticide Rods, making it active immediately upon installation – termites may begin to be eliminated before they are discovered!

Sentricon AlwaysActive offers the safety of a baiting system and the immediate protection of a chemical barrier.

Q: How will Sentricon AlwaysActive protect my home from termites?

A: It eliminates the termite colony. As soon as termites find a Sentricon station they begin feeding on the Sentricon IG Termiticide Rod, then share it with other termites in their colony to begin the colony elimination process. As the rods are always in the Sentricon stations, it provides continuous protection from termites.

The proof is in 30 independent university studies and 60 published scientific articles.

Q: How long does Sentricon AlwaysActive last?

A: The Sentricon IG Termiticide Rod that is in every Sentricon station has been shown to be effective for up to five years in Australian conditions. We recommend a full review of the system five years after installation.

Q: Will there be a big mess at installation?

A: No, it's easy on you and your home. Sentricon AlwaysActive is much less disruptive to your family, buildings and landscaping than other termite treatments. With Sentricon AlwaysActive, there is no drilling in floors or foundations, no trenching around your home, no chemical tank trucks, and no scheduling hassles. You don't even need to be present for installation and service. So basically, no mess at all.

Q: Is monitoring or ongoing inspections still required?

A: Yes, to ensure continuous protection we will be inspecting and servicing the Sentricon stations on your property every 3 to 6 months or more frequently if required. A Sentricon IG Termiticide Rod should be replaced when half or more has been consumed.

Q: I already have a monitoring system in place, how do I upgrade?

A: Upgrading to Sentricon AlwaysActive will take about the same time as your normal servicing. We will simply remove the wooden monitors from your current stations and insert the Sentricon IG Termiticide Rods.

Q: How safe is Sentricon AlwaysActive?

A: Sentricon AlwaysActive is so specific, no other insects or animals are affected by it. It is non-toxic to humans, with no irritation or sensitisation potential. It has a very low vapour pressure, so it produces no odour.
