## What is a Cabin Air Filter ?

Cabin air filters with dual layer carbon activated filter media, are designed to remove nearly 100% of airborne particles, like pollen, road dust, soot and other microscopic particles. The activated carbon also helps to remove over 80% of noxious fumes emitting from your vehicle's air vents.

## Why is a Cabin Air Filter important ?

Surrounding traffic creates poisonous gases and heavy metal pollutants that are directed straight into your vehicle's interior. Apart from the obvious health concerns, unfiltered air can lead to allergies, asthma and other respiratory problems. With over 4 million Australians suffering from allergies, our activated carbon cabin filters are an essential part of your vehicle's ventilation system.

## How do Cabin Air Filters work ?

Our Cabin Air Filters work by filtering the outside air entering your vehicle. Cabin Air Filters Australia's unique design has a first layer of sponge-like material, coated in a layer of activated carbon (each gram has the same surface area as a football field). This layer traps larger particles and helps absorb odours while maintaining the maximum surface filtering area. The second layer of fine spun micro fibre, also coated in activated carbon, helps trap dangerous smaller microscopic particles and provides an extra layer of absorption while still maintaining maximum air flow.

## Why is Cabin Air Filters Australia Different ?

Our Cabin Filters are a complete new Australian design. By greatly increasing the surface area in contact with incoming air, over conventional type "pleated filters" we are able to maintain high air flow while greatly increasing filtering capacity, with the added benefit of activated carbon coating in contact with all areas of air flow.

All our filter support bases are low allergy, cast acrylic, laser cut to suit individual vehicles, and our activated carbon is sourced from coconut shells. Our 2 stages of filter media is of the highest quality available.
