

# 5 Reasons Why Medigate is a Game Changer for IoT Security in Healthcare

**Data is the life blood of your Connected Hospital and you need a platform that can secure the explosion of IoT and medical devices pumping PHI through them.**

1

## You can only protect what you see

Medigate is the only solution that can comprehensively and accurately inventory all of your connected devices - proprietary-based medical devices and general purpose IoT devices.

2

## You need an IoT solution designed for healthcare, not all industries

It isn't only about scale; it's about depth. Medigate invested in learning the proprietary protocols and workflows to provide the clinical context needed to set up meaningful security policies.

3

## You can only detect malicious behavior if you know it's malicious

Medigate's deep analysis of clinical workflows detects anomalies in device behaviors as well as network communication traffic - both north-south and east-west traffic.

4

## You can create automated, rule-based, clinically driven security policies

Medigate's deep visibility and contextual anomaly detection integrates with firewalls and NACs so you can intelligently segment and build security policies efficiently and effectively.

5

## You can empower all stakeholders with real-time inventory visibility

Medigate provides real-time visibility and insights into everything connected to the clinical network so IT, IS, BioMed and Facilities have a common baseline to make strategic decisions.
