

Mechanical components allow for mechanical failure. The Freedom Equalizer removes mechanical fueling components while maintaining the safety and efficiency of automation.

- Eliminates Red Zone fueling

- Simple and safe

- Reduce mechanical dependency: no pumps, no motors

- No more pulling hose between equipment

- Eliminate tangled fuel lines spread across your site

- Move Horsepowers forward without disconnecting from the fueling system

- Reduce onsite footprint compared to large and complex automation units

- Reduce fixed costs compared to automation without sacrificing safety and efficiency

Pictures:

Use Front Page 1: As main pic

Front page primary:

Our tanks are positioned to match the same height as the saddle tanks located on the horsepower, doing this allows the fuel to equalize. All three tanks lower and fill simultaneously. This is not a gravity fed system.

Equalizer connection 2<sup>nd</sup> page:

We simply add a Tee with a Quick connect to the Horsepower pump's fuel tanks equalizer line. From here, we connect our auxiliary fuel line and link it to our tank located at the front of the tractor. Our fuel techs are able to fuel the frac while never entering the Redzone.
