HELICOPTER SERVICES**

ABOUT US

Central Air Work was founded with a view of helping farm and forestry clients obtain maximum production and profitability from their investments through the targeted application of agricultural chemicals and fertilisers. With all of our staff members being from an agricultural background we understand the expense involved for the client when undertaking aerial agricultural operations and place the utmost importance of achieving an accurate, effective and economic result every time.

Our helicopter is equipped with low-drift spray nozzles and GPS guidance for accuracy, this also means a map can be provided to the customer showing treated areas.

From our base at Omeo, in the Victorian High-Country we can easily travel to our service areas of South and East Gippsland, The Monaro and anywhere in between.

SPRAYING

Aerial spraying is a quick, accurate and cost effective means of weed control on your farm. Compared to a fixed-wing aircraft a helicopter offers a lower application speed and higher manoeuvrability, meaning a more effective and more accurate result.

FERTILISER APPLICATION

Fertiliser application by helicopter is cost effective and easy! We can apply most fertilisers with our purpose built spreading bucket. These include single superphosphate, Urea, Dap, Phosphate rock and more. A helicopter is not affected by wet airstrips and we can operate from confined areas such as a lane-way or yard.

All of our equipment is pattern tested to ensure an accurate and uniform application of your product.

SEEDING

Aerial seeding or over-sowing is a great way of improving less productive pastures and establishing fodder crops on areas which are otherwise not accessible. This is accomplished by a knock-down spray to ensure good weed control, followed by a seed application from our spreading bucket. The end result being a productive, weed free pasture or fodder crop.

FINE PARTICLE FERTILISER SUPPLY AND APPLICATION

Central Air Work is pleased to offer an exciting new service of applying fine particle fertilisers to drastically improve your pasture growth and soil health.

How and Why:

By finely grinding traditional agricultural nutrients (lime, nitrogen, phosphorous, potassium, sulfur etc.) to less than 60 microns, makes nutrients much more available to plants and more effective in the soil profile. Our specialist mixing equipment imported from New Zealand mixes on site a fertiliser blend containing exactly what is needed for your soil. The fertiliser blend has the appearance and consistency of flour, this is then mixed at a ratio of 70% product and 30% water, making it the consistency of thick paint which is then applied through our bucket. Trace elements, biological stimulants and chemical for broadleaf weed control can be added to the fertiliser blends, enabling weed control and fertiliser application in one pass, making this a very cost-effective operation.
