

Bio-K20

How To Use

Bio-K20 should be diluted before use.

The enzymes are activated when the water is added and the product can then be used.
Prior to application dab the area with absorbent paper to remove any excess urine and waste from the surface being treated.

Dilution rates depend on the degree of soiling,
usually between 1 : 5 and 1 : 10

Simply mix 1 part product with between 5 and 10 parts warm water
and apply by spray or by dabbing onto the surface.
Allow sufficient time for Bio-K20 to dry out slowly and naturally.

This process can be repeated if necessary until all of the stains
and odours have completely gone.

Always allow at least 3 - 4 days between applications.

Bio-K20 can also be applied through conventional
carpet cleaning machines to digest and remove stains and odours
covering a larger area.

Bio-K20 is also ideally suited for use on hard surfaces and can be used to remove
stains and odours from hard flooring.

Only make up sufficient product for one application and discard the remaining contents after use.

The diluted product only remains active for around 24 hours
so a fresh solution will be needed for further applications.

*The microbial strains in Bio-K20 are all naturally occurring
and have been classified as being harmless to humans and animals.*

PRODUCT SPECIFICATION:

Colour: Straw / Pale cream

Odour: Slight Lemon

Density: 1.02 g/ml

Shelf Life: 12 months approx.
