## WE HELP

Although millions of children suffer from pelvic floor dysfunction, it often takes a long time to receive the right treatment.

Typically, children are toilet trained by age 4. After age 4, bowel and bladder dysfunction is considered a major medical issue that affects the family unit.

Pelvic problems in children greatly influence the quality of life, self-image, social interactions, participation in sports, etc. A pelvic physical therapist can help restore normality in bladder and bowel function and prevent the progression of problems that, if untreated, may be carried over into adult life.

## WE SPECIALIZE

All pelvic physical therapy treatments are always done with a physical therapist trained in pediatric pelvic floor issues, and always with your doctor's knowledge. Children are dressed and parents and guardians are present.

During each session, your child or teen will work exclusively with one of our pelvic health physical therapists to help build strength, improve movement, and strengthen the skills and confidence needed to complete daily activities.

## WE PARTNER

Pelvic dysfunction problems in children in general, and in those with neurological pathologies even more, are markedly different from those in adults. Thus a therapist needs to work with parents, teachers, and other healthcare professionals such as urologists, GI's, pediatric physical therapists, and psychologists to provide an integrated and comprehensive plan of care.
